

LASER PHYSICS

Make sure your *Laser Physics* article is widely read, downloaded and cited

Now your work has been published, we want to ensure that it reaches the widest possible readership. There are several easy things you can do to help – look at our checklist below to see what you should do next.

- Remember to **cite your own paper** in related future articles that you publish – this saves space in your introduction and methods section and is good practice. Many scientists find papers through the reference lists of other papers. This is one of the reasons why review articles are so useful.
- Print out copies of your paper** and hand them out to colleagues at conferences. If you have a poster, attach a plastic wallet with copies of your article. If you are giving a presentation, have copies of your paper to give to those who are interested.
- Make sure that you **list and link** to all your published papers on your **professional website, university profile, and LinkedIn profile** if you have one, and make sure that it is up to date.
- Contact your institution's press office** who may be interested in publicising the research you have done whilst working there, and ask them to mention and link to your published work. Before contacting them think – “what in my paper could be relevant and interesting to the public?” How could it be explained to someone with little or no scientific background?
- E-mail your colleagues** and peers to let them know about your paper.
- If you have a **department or university newsletter**, contact the Editor with a piece about your research and your paper. Regular newsletter writers are often pleased to receive well-written copy that can be easily inserted, especially if it includes an interesting picture or photo.
- Add your paper to your **students' reading list** or nominate it for your **department's journal club** – this could be a valuable opportunity to share your expertise and can help students to more deeply understand the field and the science behind the work.
- Talk about your article at your next **departmental seminar** or meeting.
- Link to your recent papers in your e-mail signature** so that interested contacts can read your work.
- Share your paper** using the button on the article's abstract page.
- Promote your paper on social networks** such as Twitter or Facebook, post it on your blog or your department's blog, or use an **academic social networking** service such as ORCID, MyNetResearch, Google Scholar, ResearchGate, or CiteULike to share your paper with interested researchers.
- If it does not have a subscription to the journal, **encourage your institution's library to subscribe** to it in the next year.
- Check **indexing services** to make sure that all the papers you have published are listed with correct details. Make sure that your name is spelled correctly and consistently and contact the indexing service to make corrections if necessary. Your librarian should be able to help you with this.
